Abstract ¶

 Horses or Humans is a dataset of 300×300 images, created by Laurence Moroney, that is licensed CC-By-2.0 for anybody to use in learning or testing computer vision algorithms.

Aim/Purpose:

- · Data exploration of images
 - Summarise number of training/test cases.
- Neural Network building:
 - Data Augmentation:
 - Increase accuracy of validation sets
 - Rescaling/Normalize the images.
 - Rotation by angle.
 - Random shifting with range.
 - Shearing.
 - Random zooming.
 - Horizontal/Vertical Flipping.
 - Neural Network:
 - Apply transfer learning from <a href="https://github.com/fchollet/deep-learning-models/releases/download/v0.5/inception_v3_weights_tf_dim_ordering_tf_kernels_note_(https://github.com/fchollet/deep-learning-models/releases/download/v0.5/inception_v3_weights_tf_dim_ordering_tf_kernels_note_including pretained weights for human and horse.
 - Add a single Flatten Layer to convert matrix of pixels into array to further parsing.
 - Add a **Dropout** layer to probabilistically remove the inputs to a layer, which may be input variables in the data sample or activations from a previous layer.
 - Add dense layer to compile the weights and finally another one to determines the class of object.])
- Loss function in Compiling:
 - Mainly we use Cross Entropy function as log-loss function.
 - For 2 class/binary classification:
 - Binary Crossentropy with Sigmoid Function.
 - For multi class classification:
 - Categorical Crossentropy
 - Sparse Categorical Crossentropy
- Optimizer in Compiling:
 - Simple Reference: https://towardsdatascience.com/understanding-rmsprop-faster-neural-network-learning-62e116fcf29a)
 - RMSProp:

- RMS stands for root mean square.
- Keep the moving average of the squared gradients for each weight.
- And then we divide the gradient by square root the mean square.

Summary of results:

- Successfully trained a neural network model with 98% and 100% accuracy on training and validation set respectively, within 3 epoch.
- High accuracy is verified by huge pre-tained model, and probably few number of validation sets.
